LCD display type PID control temperature controller **DX SERIES**

Instruction manual

For your safety, please read the following before use

Pay attention to safety

- "Pay attention to safety" is to use the product safely and correctly to prevent the occurrence of dangerous ccidents, please comply with the following content
- * Accidents or dangers may occur under special conditions

A violation of this may result in serious injury or death.

 Δ Look out Any violation of this may result in minor injury or damage to the product.

- For machines that have a great impact on people and property (e.g. nuclear power control, medical devices, ships, vehicles, railways, aviation, flammable devices, etc.)
 Safety devices, disaster prevention/anti-theft devices, etc.), please be sure to install double safety protection devices.
 Install or use it on the panel.
 Otherwise there is a risk of electric shock or fire.

- Otherwise there is a risk of electric snock of rire.

 3. Do not connect cables or perform maintenance when the power is on.
 Otherwise there is a risk of electric shock or fire.

 4. Confirm the wiring diagram before connecting cables.
 Otherwise there is a fire hazard.

 5. Do not arbitrarily modify the product.
 Otherwise there is a risk of electric shock or fire.

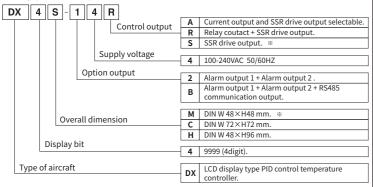

∆Look out

- 1. When connecting the power input terminal and the relay output terminal, use AWG 20(0.5mm2) or higher cables,
- 1. When connecting the power input terminal and the relay output terminal, use AWG 2U(0.5mm*) or higher cables, and maintain the torque of the screw
 0.74~0.9N·m. Sensor input and communication connection, if there is no special wire, use AWG28~16 specification cable, screw
 1. Please use within the rated specification range.
 2. Please use within the rated specification range.
 Otherwise there is a risk of fire and product failure.
- 3. Do not use water or organic solvents when cleaning. Wipe with a dry towel. Otherwise there is a risk of electric shock or fire.
- 4. It is prohibited to use in flammable and explosive corrosive gas, humidity, direct sunlight, thermal radiation, 4. It is prolinited to be in indiminate and explosive corrosive gas, numerly, direct sunlight, vibration, impact, salt environment.

 Otherwise there is a risk of fire or explosion.

 5. Do not let foreign objects such as metal debris, dust, and cable residue enter the product.

Type composition

* DX4M model . The selected size is: 48 × 48. Only choice: Seletctable RS485 com. Output and SSR drive output.

■ Name of each part 1. Measurement value (PV) display: Run mode: Displays the current measured value (PV) of the input.

Setting mode: Display parameters

2. Temperature unit (°C/°F) indicator light:

Displays the unit set in parameter group 2 temperature Unit [UNI 논].

3. Set value (SV) display unit: Run mode: Display set value (SV).

Setting mode: Displays the setting value of the paramete

4. Self-tuning indicator: blinks every 1 second when the self-tuning function is executed 5. Control output (OUT1) indicator light: When the control output is ON, the light is on. * When the cycle/phase control is used in the SSR drive output mode, the operation amount

The light is on.

6. Alarm output (AL1,AL2) indicator: When the corresponding alarm output is ON, the light is on 7. MODE key: used to enter the parameter setting group, return to the running mode, paramet movement, and store the set value.

8. Set value operation key: used to enter the state of set value change, bit movement, bit value

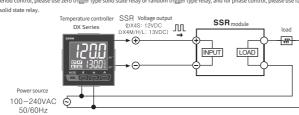

9. Function key: Press 💆 🕂 key at the same time for 3 seconds to perform the function set by [] in parameter group 2 (RUN/STOP alarm release, self-tuning). 10.PC loading port: The communication PC connection port used to set parameters through

the PC is the port for connecting the special cable EXT-US(converter cable, sold separately)+ SCM-US(USB/Serial converter, sold separately).

■ Feature

- Input correction [I N b]
- erature errors caused by external sensors, etc., but the controller itself is basically error-free When the actual temperature is 80 °C and the temperature displayed on the controller is 78 °C, set the input correction [! N - b] value to 2, so that the temperature of the controller will be displayed at 80 ° C.
- # After input correction, HHHH or LLLL will be displayed if the current temperature (PV) value is out of the range of use of the sensor Enter digital filter [TIRIVF]
- The input model changes too quickly, causing the current temperature (PV) display to be unstable, which will affect the operating capacity instability and cause the output instability.
- This function is to filter the input signal, which can achieve stable control. If the digital filter is set to 0.4 seconds, the input value within 0.4 seconds is digitally filtered before being displayed. Therefore, the current temperature may not be the same as the actual input value. SSR driver output mode function (SSRP function) [55RM]
- •SSRP function refers to the use of general SSR driver output to achieve ON/OFF control, cycle control, phase control function • Only the control output is displayed in the SSR driver output type (DX4—-—4S).
- · Can achieve linear control (cycle control, phase control), can be described as a low price to achieve precision control.
- Select one of the general ON/OFF control [55RM], period control [5ENd], and phase control [[Y[L]] parameters in the SSR driver output mode [PHR5] parameter of parameter group 2.

 For period control, please use zero trigger type solid state relay or random trigger type relay, and for phase control, please use ran
- type solid state relay

When using cycle control or phase control for control, the load and temperature controller must use the same power supply # Control mode $[C - \mathcal{H}_d]$, set to $\mathcal{P}_1 \cup \mathcal{P}_2 \cup \mathcal{P}_3$, set to $\mathcal{P}_1 \cup \mathcal{P}_3 \cup \mathcal{P}_3$, set to $\mathcal{P}_1 \cup \mathcal{P}_3 \cup \mathcal{P}_3$.

** The control output is current output or SSR drive output selectivity (DX4 \(\bullet - \(\bullet 4S \)) will not be displayed, and only general ON/OFF control can be performed through SSR. 1) Generally ON/OFF control [5 t N d] this mode Same as relay output. (ON: Output 1009) Cycle control [[Y[L]] When the load is controlled in this mode, the output is repeatedly ON/OFF in the set cycle (50 Cycle) according to the output ratio. The control accuracy is almost the same as the phase control. The zero-trigger mode is always ON/OFF at the zero of the AC, so the interference of the 50 Cycle B) Phase control [PHR5]
This mode is a mode to control the load by controlling the phase in the AC half cycle, which can achieve continuous control. A

Current output range [o.MR]

hen the control output is current output or SSR OUI 1
rive output selectivity (DXI—CHS), When the 10% ontrol output [DIE] in parameter group 2 is et to [C JRR], the upper and lower limits of the urrent output must be set to 4-20mA [α, MR] or 0-20mA from [4-20] in parameter group 2 [0-20].

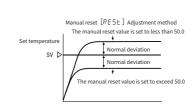

Timing function description TM-F

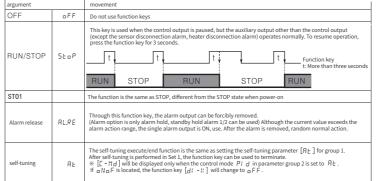

- TIME=ON has timing function M/H time unit light on, =OFF has no timing function;
 TIMF-can he guickly set to DN or OFF by long pressing MODE and adding the key for 1 second;
 The RUN Indicator blinks during timing and is steady on at the end of timing.
 When the shift key is being clicked, the current remaining time can be viewed (valid when two rows are displayed);
 When the timing ends, the bottom line displays END;

- Manual reset [RESE]
 In proportional control [P/PD control] mode, when the PV value reaches a stable state, because the heater rise and fall time may be inconsistent due to the thermal characteris of the control target, such as heating capacity, heater capacetc,, the system may have a temperature error, which is call the static error (DFFSET). The manual reset [RESE] funciously used to set/correct static errors.

Setting method If PV=SV, the manual reset value is 50.0% If PV<SV, manual reset value >50.0% If PV>SV, manual reset value <50.0%

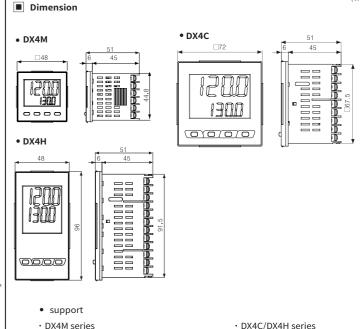

• Function key (☐ + ☐ 3 S) [♂ - ₭]

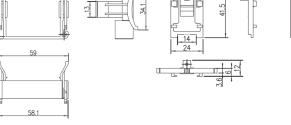

● Control the output operation [ERMV]

when the input sensor is disconnected When the input sensor is disconnected, the control output operation can be set. When the control mode [E-Md] of parameter group 2 is $_{DNDF}$, the control output is set to @@ (OFF) or

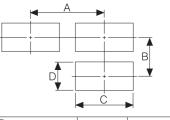

When set to P_{Id} , the setting range is $Q_0 \sim 1000$, and the user can set the amount of operation at will.

ЯМБ.□	Absolute value Lower limit alarm		ON H OFF SV PV 100°C 110°C bsolute value: Set 110°C	When PV is less than the absolute value of the alarm, the alarm output is ON.
56R□	sensor Disconnected alarm	=		The alarm output is ON when the sensor is disconnected.
L BR.	heater Disconnected alarm	_		The alarm output is ON when the heater is disconnected.

Alarm ontion

mode	name	Instructions
AM 🗌 .A	General alarm	The alarm output is ON when the alarm condition is met, and OFF when it is not met.
ЯМ □.Ь	Alarm hold	When the alarm condition is met, the alarm output is ON and its state is maintained. (Alarm output HOLD)
AM □.C	Standby alarm 1	The first time to reach the alarm value does not act, the second time to reach the alarm value according to the general alarm action After the power supply ON the first time does not act, meet the second alarm conditions according to the general alarm action.
AM □.d	Standby hold alarm 1	When the alarm condition is met, the alarm hold and the alarm wait act simultaneously. After the power supply ON the first time does not act, meet the second alarm conditions, press the alarm to keep the action.
AM □.E	Standby alarm 2	Do not act when the alarm value is reached for the first time, and press the general alarm action when the alarm value is reached for the second time. Do not act when meeting the alarm holding conditions, and press the general alarm action after lifting the alarm conditions.
Ят □.F	Standby hold alarm 2	The basic action is the same as the alarm wait 1, but not only the action when the power is ON/OFF, the alarm value, and the alarm option It also acts when it changes. So not move when the standby alarm condition is met, and press the alarm to keep moving after lifting the alarm condition

% Standby alarm 1, standby hold alarm 1 Standby alarm reapplication conditions: when the power supply is ON; Standby alarm 2, standby hold alarm 2 Standby alarm applicable conditions: when the power supply is ON, change the set temperature, alarm temperature [RL - I, RL - Z] and alarm action [RL I, RL Z], switch from stop mode to running mode.

Sensor disconnected alarm

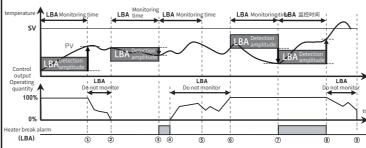

Alarm output when the sensor is not connected or when a sensor disconnection occurs in temperature control. By connecting the contact of the alarm output to the buzzer or other means, you can confirm whether the sensor

Alarm output options can be selected from General alarm [56兒月], Alarm Ho [56兒日].

Heater Break Alarm (LBA)

By controlling the temperature change of the object to determine the heater status and then issue an alarm function. When heating control (refrigeration control), the control output operation increases in PV value during LBA monitoring time [LbRt] under 100%(0%) state

If the LBA detection amplitude [L bRb] is not increased or the control output operation quantity is 0%(100%), the PV value is less than the LBA detection amplitude [L bRb] during the LBA monitoring time [L bRb], and the alarm output will be ON.

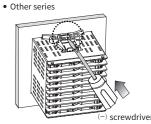

Control initiation ~①	When the control output operation is 100%, increase the LBA detection amplitude $[L \ b \ R \ b]$ or more within the LBA monitoring time $[L \ b \ R \ b]$
1)~2	Control output operation change status (LBA monitoring time reset)
2~3	When the control output operation is 0%, the detection amplitude is reduced within the LBA detection amplitude $\begin{bmatrix} L \ b R L \end{bmatrix}$ within the LBA monitoring time $\begin{bmatrix} L \ b R L \end{bmatrix}$, so the heater wire break alarm (LBA) is ON after the LBA monitoring time.
3~4	The control output operation is 0%, so the heater break alarm (LBA) remains ON.
4~6	Control control output operation change status (LBA monitoring time reset)
6~7	When the control output is 100%, the increase rate within the LBA monitoring time $\begin{bmatrix} L & D & E \\ L & D & E \end{bmatrix}$ is within the LBA detection amplitude $\begin{bmatrix} L & D & E \\ L & D & E \end{bmatrix}$. Therefore, the heater disconnection alarm (LBA) is ON after the LBA monitoring time.
7~8	When the control output is 100% , the LBA detection amplitude $\begin{bmatrix} L & DRL \end{bmatrix}$ is increased within the LBA monitoring time $\begin{bmatrix} L & DRL \end{bmatrix}$, so the heater disconnection alarm (LBA) is OFF after the LBA monitoring time.
8~9	Control output operation change status (LBA monitoring time reset)

**Performing the self-tuning will automatically set the LBA detection amplitude [$L \land R \land R$] and LBA monitoring time [$L \land R \land R$] according to the self-tuning value. Alarm action mode [$R \land R \land R$] When the heater break alarm [$L \land R \mid R \mid R$] is selected, LBA detection amplitude [$L \land R \land R \mid R \mid R$] parameters will be displayed.

Installation method

DX4M (48x48mm) series

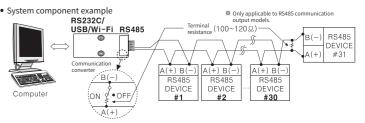

After the product is installed on the panel, use (1) a screwdriver to push in the direction of the arrow to fix it.

Communication setting

This function is the function of parameter setting and monitoring through external link devices (PC,PLC, etc.). The RS485 communication output is optional and applicable only to the model (DX4□-B4□) that supports this output.Please refer to " ■ Model composition"

οN

 Please follow the precautions in use. Otherwise, unexpected accidents may occur.
 Check the polarity of the terminal before connecting the temperature sensor.
 The thermal resistance (RTD) temperature sensor should be connected in 3-wire mode and use wires of the same thickness and length. When extending the wire of a thermocouple (TC) temperature sensor, use the specified compensation wire.

3. In order to eliminate the induction interference, please separate the product from the high-voltage line and the power line.
When installing power cables and input cables in close proximity, install filters on the power end and screen the

when installing power capies and input capies in close proximity, install intension the power end and screen the signal cables. Do not use near machines with strong magnetic fields and high frequency interference.

4. Do not use excessive force when inserting or removing the connector.

5. The switch or circuit breaker used to power on or off the product is installed nearby for the operator to operate. 6. Do not use for purposes other than temperature controller (voltmeter, ammeter, etc.)

6. Do not use for purposes other than temperature controller (voltmeter, ammeter, etc.)
7. When changing the input sensor, power off the product before changing it.
After changing the input sensor, change the associated parameters.
8. Do not route the communication cable and power cable together.
8e sure to use Twisted pair cables for communication, and link round Ferrite beads at both ends of the line to reduce external interference
9. Please reserve some space around the product to facilitate heat dissipation.

9. Please reserve some space around the product to facilitate heat dissipation.
For accurate temperature measurement, preheat for 20 minutes after power-on before use.

10. Make the voltage reach the rated voltage within 2 seconds after putting into the power supply.

11. Do not connect cables to unused segments.

12. This product can be used in the following environments.

13. Indoor (meet the ambient conditions in the specifications)

23. Below 2,000m above sea level

33. Pollution Degree 2(Pollution Degree 2)
Installation Category II(Installation Category II)
